6. Title of proposed action: McFarland & Hullinger - S102 1-6 Large Mining Project, M/045/046		
7. Description: <u>During Operations:</u> The base of the operating area is used for product stockpiling and processing of quarried material. Available topsoil was pre-stripped from this area and stockpiled for use in final reclamation. Drills holes in the quarry area will be loaded with explosives and blasted. The blasted material will fall or be pushed down to a collection point where it will be picked up by loaders. The material will then be crushed and sorted for proper size gradation. This site will produce approximately 240,000 tons a year of product. No waste will be produced. All mined and crushed material is sold as marketable product. <u>After Operations:</u> The processing areas and access roads will be reclaimed by ripping and then redistributing the stockpiled topsoil material to a 6-inch depth, then reseeded in accordance with the prescribed seed mix. The working face (highwall of the quarry) will be left as is and allowed to oxidize, returning to its original color naturally and permanently. About half of the total disturbed area will be reclaimed. The balance will remain as quarried highwall area.
